

WE FOCUS ON PACKAGING +
SUPPLY CHAIN LIMITS AND REMOVE THEM.

INDUSTRIAL PACKAGING

For more than 100 years, Deufol has helped businesses of all sizes and in all industries implement the perfect packaging and supply chain solutions for their products. With around 2600 employees in 92 global locations, we leverage our experience and unique capabilities to help you tackle any supply chain challenge.

Not all supply chains are created equal though. Your needs and objectives are unique to your specific products, customers, and logistical obstacles. Before we can develop and implement the right solutions for your goals, we have to gain an understanding of your business. That happens through conversation.

The questions below are a great starting point for that conversation. We can use this information to help you get it right the first time.

Packaging

What types of goods or products do you ship?

What type of packaging do you currently use?

What risks or hazards pose a threat to your products while in transit?

- *Movement or vibration?*
- *Temperature?*
- *Moisture?*
- *Light?*
- *Humidity?*

Is your current packaging reusable? If not, is there an opportunity to implement reusable packaging?

What is the primary mode of transportation for your products?

Do any of your customers have specific packaging requirements?

Do you or your customers have sustainability targets?

Is your current packaging custom-designed for your needs or a generic solution?

Are you unsure about the answers to some of these questions? A conversation with one of our packaging specialists could help you determine if it's time to consider an alternative solution. **Let's start the conversation today.**

INDUSTRIAL PACKAGING

Supply Chain

Packaging is only one part of the supply equation. There's also the challenge of getting your product to the next destination, and doing so in a way that ensures quality and minimizes cost. Deufol can help you implement a supply process that achieves those objectives and meets all of your supply chain goals.

What kind of technology do you use to manage and monitor your supply chain?

Do you use any of the following technology to protect product quality during transit?

- *Photo documentation of goods?*
- *GPS to monitor location, movement, temperature, moisture exposure, and more?*
- *Barcode/scanning systems?*

Do you ship from your own warehouse or do you use a third-party to house your inventory?

Are your products hazardous? Are they required to meet specific safety regulations while in transit?

Do your customers require unique labeling or barcodes? Do you ship to customers like the U.S. military, who have rigid product-acceptance procedures?

To what extent do you use automation and software to optimize your supply chain's efficiency?

Do you ship to international customers?

Again, this is a starting point for a conversation. We welcome the opportunity to discuss your packaging and supply chain goals in greater detail. We can then present recommendations and develop and implement solutions.

Let's connect today and discuss your supply chain challenges.
